 Center project name: bM309D15
 NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 OM nucleic
Pred. No.
score grea
and is der
No. is the number of results predicted by chance to have a greater than or equal to the score of the result being printed, s derived by analysis of the total score distribution.

 The present invention relates to a method of diagnosing a cellular CC proliferative disorder of breast tissue, which involves determining the CC state of methylation of one or more nucleic acids isolated from the CC subject, where the state of methylation of the nucleic acids as compared With a state of methylation from a subject not having the cellular CC proliferative disorder of breast tissue is indicative of a cellular CC proliferative disorder of breast tissue in the subject. The nucleic acids may be TWIST, HOXA5, NES-1, retinoic acid receptor beta (RAEDeta), CC cestrogen receptor, cyclin D2, Wilms' tumour gene (WT-1), 14.3.3 sigma, CC HIN-1 or RASSPIA. The method is useful for diagnosing and/or determining CC a predisposition to a cellular proliferative disorder, in particular CC breast cancer including ductal carcinoma in situ, lobular carcinoma, colloid carcinoma, tubular carcinoma in situ, lobular carcinoma, metaplastic carcinoma, in situal carcinoma in situ. Inbular carcinoma in situ and CC papillary carcinoma in situ. The present sequence is a gene fragment used in the exemplification of the invention.

 CC mouse N-acetylglucosamine 6-0-sulfotransferase (see AAY3156), an CC enzyme capable of transferring a sulfate group from a sulfate group CC donor to a hydroxyl group at the 6 position of an N-acetylglucosamine CC represented by the formula GlcNxcbetal-3Glabetal-4GlcNxc, where CC GlcNxc = N-acetylglucosamine residue, Gal = galactose residue, CC beta 1-3 = beta 1-3 glycosidic linkage, and beta 1-4 = beta 1-4 CC glycosidic linkage. The cDNx was isolated from a mouse embryo CC cDNx library by PCR amplification. The enzyme is useful for the CC synthesis of sugar chains such as GlyCAM-1, a ligand of L-selectin CC that is involved in homing of lymphocytes and rolling of leukcytes CC cenzyme is expected to be used for the large-scale production of CN -acetylglucosamine-6-O-sulfotransferase, or artificial synthesis of GlyCAM-1 using transformants which harbour the DNA.

 The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a cDNA of the present sequence of the present sequence is a cDNA of the present sequence.

| be employed as diagnostic reagents for detection of mutations in the above stated diseases. The present sequence is human HCN2 channel DNA.                                                                                                                                                                                                                                                             | ដ្ឋប្រជុ            |
| treating pain, gut disorders, in particular Irritable bowel syndrome (IBS) or Bleep disorders. HCN polynuclectides and polypeptides may also                                                                                                                                                                                                                                                            | กก                  |
| injury, epilepsy. Alzheimer's disease, Parkinson's disease, learning or memory and attention disorders. These compounds may also be used in                                                                                                                                                                                                                                                             | ដែត                 |
| The invention relates to new uses of human hyperpolarisation-activated, cyclic nucleotide-gated (HCN) channel polypeptides and their polynucleotides. The HCN channel polypeptides and polynucleotides can be used in the manufacture of medicaments to treat stroke, isohaemia, head                                                                                                                   | ដ្ឋមួយ              |

The present invention describes a method (M1) for selecting a domestic animal for having desired genotypic properties. The method comprises testing the animal for the presence of a parentally imprinted quantitative trait locus (QTL). The pig QTL is located at chromosome 2, mapping at around position 2pl.7. Also described are: (1) an isolated and/or recombinant nucleic acid (M1) comprising a parentally imprinted QTL or its functional fragment; (2) an isolated and/or recombinant nucleic acid (M2) comprising a synthetic parentally imprinted QTL derived from at least one chromosome or its functional fragment; (3) an animal such as pig selected for having desired genotypic or potential phenotypic properties; (4) a transgenic animal comprising N1 or N2; and (5) sperm or an embryo derived from the animal of (3) or (4). N1 or its
 Selecting a domestic animal for having desired genotypic properties comprises testing the animal for the presence of a parentally imprinted quantitative trait locus which is related to muscle mass and/or fat denomination.

The invention relates to maize haemoglobin (Hb) polypeptides and encoding polynucleotides. The maize Hb genes are used to enhance seed germination and seedling growth, manipulate the oxygen concentration in a plant cell, and modulate haemoglobin levels in a plant cell. They can be used to produce transgenic monocot and dicot plants. The Hb polynucleotides can produce metabolites, preferably haemoglobin, of interest in plant cell tissue cultures where quick growth and high density can be obtained. The present sequence represents a maize WHbl polypeptide encoding cDNA.

 detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polynucleotides. The probes can be used for chromosome mapping of the polynucleotide and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polynucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcingenesis pathway and/or monitor the efficacy of therapies and preventive interventions. The polynucleotides, polypeptides and antibodies against them can be used in pharmaceutical compositions to treat the cancers and proliferative disorders such as neoplasia,

 The present sequence encodes a protein designated HTHBZ47. The protein is a member of the Kringle protein family. Detection of the amount of HTHBZ47 protein in a sample from a patient may be used to diagnose diseases such as cancer, rheumatoid arthritis, asthma, Alzheimer's diseases multiple sclerosis, septic shock, stroke and AIDS. Similarly, detection of a mutation in the gene encoding HTHBZ47 may be used in diagnosis. The protein may be used to identify its agoniets and antagonists, and to identify its agoniets and antagonists, and to identify its agoniets and antagonists, and to identify its agoniets and antagonists.

 The invention discloses isolated nucleic acids, and the protein that they encode, of novel human kinases. Kinases mediate the phosphorylation of a wide variety of proteins and compounds in the cell and are involved in a range of regulatory pathways. The novel human polynucleotides, encoding proteins sharing sequence similarity with animal kinases, are useful for diagnosing or treating (e.g. gene therapy) disorders. The sequence presented is a cDNA encoding a human kinase.

 The invention relates to a novel enzyme of starch biosynthetic pathway in a cereal plant, where the enzyme is selected from starch branching enzyme (SBS) I, SBE II, starch soluble synthase (SSS) I, and debranching enzyme (DBE), with the proviso that the enzyme is not SSS I of rice, or SBE II of rice or maize. The methods and products can be used for targeting expression specifically to the endosperm of the seeds of cereal plants such as wheat or barley. They can be used for the expression of e.g. antisense sequences of granule-bound synthase (GBSS), SBE II, low mol. wt. glutenin, grain softness protein I, bacterial sloamylase, bacterial glycogen synthase, and wheat high mol. wt. glutenin BX17. They can be used for modifying the characteristics of starch produced by a plant. The present sequence represents the wheat SBE I promoter

 CC pharmacogenomics. NHP sequences are utilised in microarrays or other CC assay formats, to screen collections of genetic material from patients CC who have a particular medical condition. NHP nuclectide sequences are useful for drug screening effective in the treatment of symptomatic or CC phenotypic manifestations of perturbing the normal function of NHP in the CC desired and nucleotide constructs encoding NHP products are used to CC genetically engineer host cells to express NHP products in vivo. These CC genetically engineered cells function as bioreactors in the body continuous supply of a NHP, a NHP peptide, or a NHP fusion CC protein to the body. Nucleotide constructs encoding NHP products are also CC useful in gene therapy for modulating NHP expression. The encoded NHP CC polypeptides are useful for generating antibodies, as reagents in CC diagnostic assays, for identifying other cellular gene products related to NHP and as reagents in assays for screening for compounds that are CC useful in the treatment of mental, biological or medical disorders and CC diseases. The gene for the NHPs is located on human chromosome 6.

CC The invention relates to an isolated nucleic acid molecule comprising a CC nucleotide sequence encoding a novel human protein (NHP) appearing CC as ABG69450. Hat share structural similarity with animal CC kinases, including serine-threonine kinases, casein kinases, calcium/calmodulin-dependent protein kinases and mitogen activated CC calcium/calmodulin-dependent protein kinases and mitogen activated CC kinases. NHP oligonucleotides are useful as hybridisation probes for CC screening libraries and assessing gene expression patterns. NHP CC encoded by the NHP sequences. Sequences derived from regions adjacent to the intron/exon boundaries of NHP gene can be used to design primers CC for use in amplification assays to detect mutations within the exons, CC splice sites, introns that can be used in diagnostics and pharmacogenomics. NHP sequences are utilised in maioroarrays or other assay formats, to screen collections of genetic material from patients CC who have a particular medical condition. NHP nucleotide sequences are useful for drug screening effective in the treatment of symptomatic or CC useful for drug screening effective in the treatment of symptomatic or CC genetically engineer host cells to express NHP products are used to constructs encoding NHP products in the body, and nucleotide constructs encoding NHP products in the body and nucleotide constructs encoding NHP products are used to construct supply of a NHP, a NHP peptide, or a NHP fusion CC disgnostic assays, for identifying other cellular gene products related CC useful in the treatment of mental, biological or medical disorders and CC disgnostic assays. For identifying other cellular gene products related CC useful in the treatment of mental, biological or medical disorders and CC disgnostic assays. For identifying other cellular gene products related CC useful in the treatment of mental, biological or medical disorders and CC disgnostic services and constructs encoded and NHP of the invention.
 Novel polynucleotides encoding human proteins that related to animal kinases, useful for drug screenir gene therapy of biological disorders

 The invention discloses isolated nucleic acids, and the protein that they encode, of novel human kinases. Kinases mediate the phosphorylation of a wide variety of proteins and compounds in the cell and are involved in a range of regulatory pathways. The novel human polynucleotides, encoding proteins sharing sequence similarity with animal Kinases, are useful for diagnosing or treating (e.g. gene therapy) disorders. The sequence presented is a cDNA encoding a human kinase.

CC The invention relates to an isolated nucleic acid molecule comprising a CC nucleotide sequence encoding a novel human protein (NHP) appearing CC as AB669450-B669460, that share structural similarity with animal CC kinases, including serine-threonine kinases, casein kinases, casein kinases, calcium/calmodulin-dependent protein kinases and micogen activated CC kinases. NHP oligonucleotides are useful as hybridisation probes for CC screening libraries and assessing gene expression patterns. NHP CC sequences are useful to identify mutations associated with a particular cc disease and also as a diagnostic or prognostic assay, and also in the CC molecular mutagenesis/evolution of proteins that are at least partially encoded by the NHP sequences. Sequences derived from regions adjacent to the intron/exon boundaries of NHP gene can be used to design primers CC for use in amplification assays to detect mutations within the exons, CC splice sites, introns that can be used in diagnostics and particular medical condition. NHP nucleotide sequences are useful for drug screening effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the CC useful in gene therapy for modulating NHP products are used to genetically engineer host cells function as bioreactors in the body and nucleotide constructs encoding NHP products are used to complypeptides are useful for generating antibodies, as reagents in continuous supply of a NHP, a NHP peptide, or a NHP fusion CC useful in gene therapy for modulating NHP expression. The encoded NHP constructs encoding other cellular gene products are also useful in the treatment of mental, biological or medical disorders and CC diseases. The gene for the NHPs is located on human chromosome 6.

The present sequence encodes an NHP of the invention.

 The invention discloses isolated nucleic acids, and the protein that they encode, of novel human kinases. Kinases mediate the phosphorylation of a wide variety of proteins and compounds in the cell and are involved in a range of regulatory pathways. The novel human polynucleotides, encoding proteins sharing sequence similarity with animal kinases, are useful for diagnosing or treating (e.g. gene therapy) disorders. The sequence presented is a cDNA encoding a human kinase.

The invention relates to an isolated nucleic acid molecule comprising a CC nucleotide sequence encoding a novel human protein (NHP) appearing CC as AB69450-AB69469, that share structural similarity with animal CC kinases, including serine-threonine kinases, casein kinases, calcium/calmodulin-dependent protein kinases, casein kinases and mitogen activated CC kinases. NHP oligonucleotides are useful as hybridiastion probes for CC screening libraries and assessing gene expression patterns. NHP CC sequences are useful to identify mutations associated with a particular concludar mutagenesis/evolution of proteins that are at least partially encoded by the NHP sequences. Sequences derived from regions adjacent to the intron/exon boundaries of NHP gene can be used to design primers CC for use in amplification assays to detect mutations within the exons, comparations that can be used in diagnostics and concludar medical condition. NHP mucleotide sequences are useful for drug screening effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body, and nucleotide constructs encoding NHP products are used to delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion CC useful in gene therapy for modulating NHP expression. The encoded NHP CC useful in the treatment of mere also or seful in the treatment of mere also or a seguence are useful to NHP and as reagents in assays for screening for compounds that are also one of the number of the NHP is located on human chromosome 6.

The gene treatment of mental, biological or medical disorders and condition.
 Novel polynucleotides encoding human proteins that are structurally related to animal kinases, useful for drug screening, diagnosis and gene therapy of biological disorders

 The present sequence is the promoter region of pig complement inhibitor DNA. It allows human complement inhibitors or other thrombus formation inhibiting factors (e.g. thrombomodulin) to be expressed efficiently in transgenic pigs, when inserted upstream a human DNA sequence. This prevents hyperacute rejection, when organs or tissue from the transgenic pigs are transplanted into humans.

 This sequence is a fragment of the Kaposi's sarcoma-associated CC herpesvirus (KSHV) LUR (long unique region). This fragment contains CC coding regions for KI. ORF4 which encodes the complement binding protein CC v-CBP, ORF6 which encodes a ssDNA binding protein (SSBP), ORF7 which encodes but polymerase (pol), ORF10, ORF11, KZ which encodes viral complement benefit by the encodes but polymerase (pol), ORF10, ORF11, KZ which encodes viral complement bunding protein B, ORF9 contains a sport of the encodes but polymerase (pol), ORF10, ORF11, KZ which encodes viral complement protein E, ORF02 which encodes dihydrofolate reductase (DHFR), K3 which encodes buy4-1E1 I, K5 which encodes buy4-1E1 II, K6 (CC which encodes wMIP-II, K7, ORF16 which encodes Bel-2, ORF17 which encodes complement protein I, ORF18 and ORF19 which encodes Tegument protein I. CC (KSHV is a new human Herpesvirus (HHV8) believed to cause Kaposi's sarcoma (CC (KS) which is the most common form of neoplasm occurring in persons with a caputaed immane deficiency syndrome (ALDS). The DHFR protein is useful for vaccination, prophylaxis, diagnosis and treatment of a subject with Kaposi's sarcoma in a cell.

 CC This sequence represents the long unique region and terminal repeat of CC the Kaposi's sarcoma-associated herpes virus (KSHV). KSHV is also known CC as human herpes virus (SHV). This sequence contains the DNAs of the CC invention which encode KSHV polypeptides selected from: (a) viral CC macrophage inflammatory protein (MTP) II; (b) viral interleukin-6 (II-6); CC (c) viral IRF 1; (d) complement-binding protein; glycoproteins B, M or L; (d) capsid protein IV encoded by ORF65; and (e) immediate early protein CC encoded by ORF73. Labelled probes for the nucleic acid, proteins encoded CC by it, and antibodies (Ab) specific for the proteins are useful for CC detecting HHVB, specifically for diagnosis of Kaposi's sarcoma, in body CC fluids or tissue samples. HHVB infections can be treated with antisense CC or triplex forming molecules or agents that bind specifically to the protein. Ab may be used for prophylaxis or treatment of HHVB infection, CC while the protein can be used in protective vaccines. Ab may also be used to differentiate between lymphomas, and HHVB may be implicated in many CC other lymphoproliferative diseases such as lymphomas, leukaemia, CC splenomegaly and mycosis fungoides. Cells and animals containing the used to a targets for antiviral drugs, e.g. dihydrofolate reductase gene can be inhibited with methortexate. These can also be used to determine the immune status of a patient infected with HIV. HHVB derived protein containing the used used as an anti-inflammatory agent for. Stated in used as topation time testing rheumatoid arthritis. This sequence is stated as containing the open reading frames!

 Here is a proper construction of the Barkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2, cn bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo. NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

- Web : www.genoscope.cns.fr |

- Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2, cn bw sp, the same strain used for the DGP's pl and bow to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDCP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

submitted (23-JUL-1999) Genoscope - Centre National de Sequencage : BP 191 91006 EVRY cedex - FRANCE (E-mail : seqref@genoscope.cns.fr - Web : www.genoscope.cns.fr)

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - collaboration with the European Drosophila melanogaster BAC http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre 1) European Brosophila melanogaster BAC (Eude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Stimated insert size: 126288; sum-of-contigs estimation
Quality coverage: 7.48 in Q20 bases; pulse field gel estimation
Quality coverage: 7.76 in Q20 bases; sum-of-contigs estimation.

* NOTE: This is a 'working draft' sequence. It currently

* consists of 13 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the flished sequence

* as soon as it is available and the accession number will

* be preserved.

1116. Contigs of 1116 ho in length
 Submitted (26-JAN 2000) Production Sequencing Facility, DOE Joint Genome Institute, 2800 Mitchell Drive, Walnut Creek, CA 94598, USA On Apr 20, 2001[this sequence version replaced gi:7711676.

Center project Information

Center project name: 16686

Center clone name: 451 H_ 23

Center clone name: 451 H_ 23

Sequencing vector: M13; M77815; 100% of reads

Chemistry: Dye-terminator Big Dye; 100% of reads

Chemistry: Dye-terminator Big Dye; 100% of reads

Assembly program: Phrap; version 0.960731

Consensus quality: 150422 bases at least Q40

Consensus quality: 159524 bases at least Q30

Consensus quality: 159524 bases at least Q20

Insert size: 155247; sum-of-contigs

Quality coverage: 3.6 in Q20 bases; sum-of-contigs
 NOTE: This is a 'working draft' sequence. It currently consists of 32 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a 'working draft' sequence. It currently
* consists of 4 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary, Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

 * NOTE: Estimated insert size may differ from sequence length

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html)

* NOTE: The contigs are based on the application

* of the PGI method using the Human genome (NCBI build 31)

* as the comparative genome.

* NOTE: This is a 'working draft' sequence. It currently

* consists of 1 contigs. Gaps between the contigs

* are represented as runs of N. The order of the pieces

* is believed to be correct as given, however the sizes

* is believed to be correct as given, however that have

* provided by the submittor.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

1 167624: contig of 167624 bp in length.

 NOTE: This is a 'working draft' sequence. It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

misc\_feature

```
gene sequence shown below is considered a pseudogene because of the terminating codon at base 429. There are only two additional single-base differences between the coding sequences of the zeta and pseudozeta genes, although there are conspicuous differences in the 5' and 3' flanking regions. Moreover the first intron of this locus demonstrates length variation, apparently stemming from the repeat sequence acquence acquence coggggggy, which is also found in the zeta gene and, in a similar form, in the 5' flank of the human insulin functions of the zeta genes [1].
 Eukaryota; Metadoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

1 (Dases 1 to 2685)

Proudfoot,N.J., [Gil,A. and Maniatis,T.

The structure of the human zeta-globin gene and a closely linked, nearly identical pseudogene

 Original source text: xenopus laevis dna; clone pxir101 (Nucleic Acids Res. 8, 2871-2884 (1980)),[2],[3],[4].

Acids Res. 8, 2871-2884 (1980)),[2],[3],[4].

[3] comparison with scerevisiae 18s rdna revealed extensive regions of high homology interspersed with tracts having little or no homology. regions of high homology contain almost all the rna methyl groups major regions of low homology are considerably richer in 'c' and 'g' in xenopus than in the yeast [3]. [4] found that there are not initiation (atg) codons in the ets region and that there are not initiation (atg) codons in the ets region and that as in other x.laevis rdna clones, the sequence preceding the ets is duplicated, with a few changes, in the 'bam island' sequence of the non-transcribed spacer.

 This sequence was assembled from refs.1-6 above. The FRNA gene j present as multiple tandem repeats. The non-transcribed region approximately 5kB long, and includes entries XLRNA3 and XLRNA6. There is considerable variation between gene copies in all the non-coding regions, as described in 1-7 and references therein location/Qualifiers

| **NOTE Estimated insert size may differ from sequence length (see http://www.hggc.bom.tmc.edu/docs/Genbank draft_data.html).  **NOTE: This is a 'working draft' sequence. It currently consists of 65 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gap's between the contigs are represented as. runs of N, but the exact sizes of the gaps are unknown.  **This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.  1007 2522: contig of 1006 bp in length 2523 2622: gap of unknown length 2523 2622: gap of unknown length 2523 2622: gap of unknown length 2524: contig of 1416 bp in length 2525 6509: contig of 1345 bp in length 2525 6509: contig of 1345 bp in length 2526: gap of unknown length 2527 9909: contig of 1017 bp in length 2528: gap of unknown length 2529 10009: gap of unknown length 2520: gap of unknown length 2521 1009: gap of unknown length 2522 gap of unknown length 2523 2622: gap of unknown length 2524: gap of unknown length 2525 6509: contig of 1017 bp in length 2526: gap of unknown length 2527 9909: contig of 1018 bp in length 2528 1009: gap of unknown length 2529 1009: gap of unknown length 2520 1009: gap of unknown length 2521 1009: gap of unknown length 2522 1009: gap of unknown length 2523 1009: gap of unknown length 2524: gap of unknown length 2525 1009: gap of unknown length 2526 1009: gap of unknown length 2527 1009: gap of unknown length 2528 1009: gap of unknown length 2529 1009: gap of unknown length 2529 1009: gap of unknown length 2520 1009: gap of unknown length 2521 1009: gap of unknow                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Olarnpunsagoon, A.; Pal, S., Parks, K., Pasternak, S., Paul, H., Perez, A., Perez, L., Pfannkoch, C., Plopper, F., Boindexter, A., Perez, A., Perez, L., Pfannkoch, C., Plopper, F., Boindexter, A., Perez, A., Parian, S., Pul, LL., Puazo, M., Quiroz, J., Rachlin, E., Popovic, D., Primus, E., Pul, LL., Puazo, M., Quiroz, J., Rachlin, E., Reves, K., Rejeir, M., Reigh, R., Reilly, B., Reilly, M., Ren, Y., Rose, M., Richards, S., Riggs, F., Rives, C., Rockey, T., Rojas, A., Race, M., Shatsman, S., Shen, H., Shetty, J., Shvartsbyn, A., Sordtk, A., Tabor, P., Taylor, C., Taylor, T., Thomas, N., Thomas, S., Yotakek, A., Tabor, P., Taylor, C., Taylor, T., Thomas, N., Villasania, D., Waldron, L., Walker, B., Wang, C., Wang, S., Warren, J., Yoon, L., Yoon, V., Yu, F., Zhang, S., Warren, J., Yon, J., Yoon, V., Yu, F., Zhang, S., Warren, J., Yon, J., Yoon, V., Yu, F., Zhang, S., Warren, J., Yon, J., Yoon, V., Yu, F., Zhang, J., Zhou, J., Zhou, X., Zhou,      |

 NOTE: This is a 'working draft' sequence. It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence

1,4

 The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E., Tateno,M., Catanese,J.J. and de Jong,P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org
 MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. John D.
Mapping information for this clone was provided by Dr. John D.
McPherson, Department of Genetics, Washington University, St. Louis
MCP For additional information about the map position of this
MO. For additional information about the map position of this
sequence, see http://genome.wustl.edu/gsc
 NEIGHBORING SEQUENCE INFORMATION: This sequence is not the entire insert of the clone. This clone overlapped by AC064860 and AC084377.
 The sequence of AC061962 has been incorporated into AC109826.
Location/Qualifiers
 from more than one subclone; and the assembly was confirmed by restriction digest.

 COMMENT
 NOTE: This is a 'working draft' sequence. It currently consists of 48 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Delgado, O., Denson, S., Deramo, C., Ding, Y., Dinh, H., Divya, K., Braper, H., Dugan-Rocha, S., Dunn, A., Durbin, K., Duval, B., Eaves, K., Egan, A., Escotto, M., Eugene, C., Evans, C.A., Falls, T., Fan, G., Francer, A., Escotto, M., Edgene, C., Evans, C.A., Falls, T., Fan, G., Farls, T., Fan, G., G., Finley, M., Flagg, M., Forbes, L., Foster, M., Poster, P., Fraser, C.M., Gabisi, A., Ganta, R., Garcia, A., Garrer, T., Garza, M., Guerra, W., J., Lin, J., Lin, J., Lin, J., Lin, J., Lobox, H., Henderson, N., Johnson, R., J
 2 (bases 1 to 44508)
Rat Genome Sequencing Consortium.
Direct Submission
Submitted (29-OCT-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, XT 77030, USA
 NOTE: Batimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 26 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
 Center project Information
Center project name: KDBL
Center clone name: KDBL
Center clone name: CH230-426019

Sequencing vector: Plasmid;
Chemistry: Dye-terminator Big Dye: 100% of reads
Assembly program: Phrap; version 0.990329

Consensus quality: 24050 bases at least Q40
Consensus quality: 27314 bases at least Q30
Consensus quality: 29391 bases at least Q20
 Center: Baylor College of Medicine Center code: BCM
Web site: http://www.hgsc.bcm.tmc.edu/
Contact: hgsc-help@bcm.tmc.edu

 The present invention relates to a method of diagnosing a cellular corpoliferative disorder of breast tissue, which involves determining the state of methylation of one or more nucleic acids isolated from the subject, where the state of methylation of the nucleic acids as compared with a state of methylation from a subject not having the cellular proliferative disorder of breast tissue is indicative of a cellular proliferative disorder of breast tissue in the subject. The nucleic acids may be TMIST, HOXAS, NES-1, retinoic acid receptor beta (RARbeta), cestrogen receptor, cyclin D2, wilms, tumour gene (WT-1), 14.3.3 sigma, cestrogen receptor, cyclin D2, wilms, tumour gene (WT-1), 14.3.3 sigma, the predisposition to a cellular proliferative disorder, in particular breast cancer including ductal carcinoma in situ, lobular carcinoma, colloid carcinoma, tubular carcinoma, medullary carcinoma, metaplastic carcinoma, in situ and carcinoma in situ and papillary carcinoma in situ and carcinoma in situ and papillary carcinoma in situ and carcinoma in situ and papillary carcinoma in situ and carcinoma carcinoma in situ and carcinoma ca

 polymucleotide sequences. These are used in the method of the invention of for detecting target LUIOS specific acid. The method comprises treating a complement with at least one LUIOS specific nucleic acid, or its complement which is at least 50 percent identical with the LUIOS specific nucleic acid, or its complement acid sequences (AAVS4616 to AAVS4621). LUIOS is a lung disease marker. Cells transformed with a recombinant expression system that contains LUIOS specific nucleic acid fragments, are used to express recombinant cullios polypeptides which are used to raise antibodies. The antibodies are used to detect the LUIOS antigen, and correspondingly this antigen is cused to detect specific antibodies, in usual immunoassays. The LUIOS polypeptides and nucleic acid, sequences are used for diagnosis, staging, conspiculties are used to termination of susceptibility to, lung disease, specifically cancer. The LUIOS therapeutically. LUIOS is a marker for lung disease (present at high concentration, in altered form or in an unusual body compartment). LUIOS can be detected in blood, plasma or serum in an inexpensive, non-invasive

Lal P, 7 Tang Au-Young J, GA, Yue H, Patterson C, Reddy Baughn MR; R, Hillman ď.

New human signal peptide-containing proteins useful in treatment, prevention and diagnosis of e.g. cancer, inflammation and cardiovascular disease

Claim 9; Page 289; 327pp; English.

CC AAZ98109 to AAZ98242 encode AAY87324 to AAY87357 which represent the CC human signal peptide-containing proteins HSPP-134. HSPPs have CC anticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities and can CC be used in gene therapy. HSPPs can be used to treat or prevent disorders CC associated with decreased activity or function of HSPP. Antagonists of CC HSPP are used to treat or prevent disorders associated with increased cC ciriotity or function of HSPP. Such diseases include cell proliferation CC reproductive or developmental disorders, (e.g. arteriosclerosis, anemia, cC including cancer) inflammation, cardiovascular, neurological, cC reproductive or developmental disorders, (e.g. arteriosclerosis, anemia, cC asthma, Crohn's disease, microbial or other infections, congestive or ischaemic heart disease, Altheimer's, Parkinson's or Huntington's CC diseases, schizophrenia, ovulatory defects, muscular dystrophy). HSPP CC nucleic acids can be used for the recombinant production of HSPP, for CC diagnosis and monitoring), in gene therapy, as antisense, CC diagnosis and monitoring), in gene therapy, as antisense, CC diagnosis and monitoring), in gene therapy, as antisense, congestic variations, and for chromosomal mapping. HSPP are also used to craise specific antibodies (Ab) and too screen for agonists and continued therapeutic agents). Ab are used to diagnose, or consistor, HSPP-related diseases (in usual immunoassays), as therapeutic cantagonists in competitive drug screens, and for purification of HSPP cC antagonists in competitive drug screens, and for purification of HSPP cC antagonists in competitive drug screens, and for purification of HSPP cC antagonists in competitive drug screens, and for purification of HSPP cC antagonists in competitive drug screens, and for purification of HSPP cC antagonists.

 The present sequence is a lung specific gene (LSG) Lng107 from human clone ID 586271. The LSG has high level of tissue specificity for lungs and is overexpressed in cancerous tissues. The sequence serves as a diagnostic marker for detecting, monitoring, staging and prognosticating lung cancer. The diagnosis involves comparing levels of LSG in samples obtained from patient and normal control.

New nucleic acid for the lung disease marker LU105 - polypeptides, antibodies and genes, used for diagnosis, prevention, treatment of lung disease, specifically cancer

Claim 11; Fig 1; 123pp; English.

Sequences shown in AAV54616 to AAV54621 represent LU105 specific
CD polynucleotide sequences. These are used in the method of the invention
CC for detecting target LU105 nucleic acid. The method comprises treating a
CC sample with at least one LU105 specific nucleic acid, or its complement
CC which is at least 50 percent identical with the LU105 specific nucleic
CC acid sequences (AAV54616 to AAV54621). LU105 is a lung disease marker.
CC LU105 specific nucleic acid fragments, are used to express recombinant
CC LU105 specific nucleic acid fragments, are used to express recombinant
CC LU105 specific acid fragments, are used to express recombinant
CC used to detect the LU105 antigen, and correspondingly this antigen is
CC used to detect specific antibodies, in usual immunoassays. The LU105
CC polypeptides and nucleic acid sequences are used for diagnostis, staging,
CC monitoring, prognosis, prevention, treatment and determination of
CC susceptibility to, lung disease, specifically cancer. The LU105
CC polypeptides are also used to screen for specific binding agents, useful
CC therapeutically. LU105 is a marker for lung disease (present at high
CC concentration, in altered form or in an unusual body compartment). LU105
CC can be detected in blood, plasma or serum in an inexpensive, non-invasive

on 25-MAR-2003 to correct PI field.)

 The invention provides membrane-bound PRO polypeptides and polymucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDI receptors, TIE ligands and various enzymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially by recombinant techniques.

The present invention describes human secreted and transmembrane proproteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bloattive molecules, such as coxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful resgents. The PRO
 PRO polynucleotides used bioactive molecules such specific cells, to cause

 nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAR44270 to AAR44470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAR44087 to AAR44269 and AAR65154 to AAR63300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.

CC polypeptides are useful in detecting PRO polypeptide. The PRO CC polypeptides are useful in detecting PRO polypeptides in a sample, in CC polypeptides are useful in detecting PRO polypeptide. PRO polypeptide, and CC in modulating at least one biological activity of a cell expressing a PRO polypeptide, and CC useful for treating cardiac insufficiency disorders. PRO1312 stimulates hypertrophy of neonatal heart and is thus polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus grantly property of the p

 The invention discloses isolated PRO secreted/transmembrane polypeptides CC comprising a sequence without signal peptide and the nucleic acid comprising a sequence without signal peptide on the nucleic acid CC encoding them. The polypeptides can be used to raise antibodies that CC specifically bind to the PRO polypeptide, for linking a bioactive of molecule to a cell expressing a PRO protein and for modulating at least CC one biological activity of a cell. The PRO polypeptides or CC polymucleotides are useful in gene therapy, in chromosome CC identification, as chromosome markers, or in generating probes. The PRO polypeptides are useful as molecular markers for protein CC electrophoresis, and the isolated nucleic acids may be used for ccombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful caids may also be used in tissue typing. Anti-PRO antibodies are useful caids may also be used in tissue typing. Anti-PRO antibodies are useful caids may also be used in tissue typing. Anti-PRO antibodies are useful caids may also be used in tissue typing. Anti-PRO antibodies are useful caids may also be used in tissue typing. Anti-PRO antibodies are useful caids may also be used in tissue typing. Anti-PRO antibodies are useful caids may also be used in tissue typing. Anti-PRO antibodies are useful caids may also be used in tissue typing. Anti-PRO antibodies are useful caids may also be used in tissue typing. Anti-PRO antibodies are useful caids may also be used in tissue typing. Anti-PRO antibodies are useful caids may also be used in tissue typing and the probability of PRO probability of PRO caids and the probability of PRO probability of PRO caids and the probability of PRO

The invention discloses isolated PRO secreted/transmembrane polypeptides comprising a sequence without signal peptide and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or polynucleotides are also useful as pharmaceuticals, diagnostics, biosensors or bioreactors, for detecting or treating e.g. tumours in mammals, e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats or rabbits as targets for therapeutic intervention in certain cancers colon, lung or breast cancers) and diagnostic determination of the presence of these cancers. The PRO polypeptides are also useful as molecular weight markers or for chromosome identification. The PRO genes
 New secreted and transmembrane PRO polypeptides (e.g. PRO183, PRO184, PRO361 or PRO846) useful as targets for therapeutic intervention in cancers (e.g. lung or breast cancers), or for diagnosing these cancers

 genetic
gene the
 are useful as hybridisation probes or for screening libraries of hunceDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequences presented in ABX79290-ABX79675 are the genes encoding, the primers amplifying and the probes detecting the PRO polynucleotides of the invention.

Note: The sequence data for this patent is also available in electrons.

 The present invention relates to the isolation of novel human PRO CC polypeptides, and the polynucleotide sequences encoding them. The CR PRO polypeptides are secreted and transmembrane proteins. The PRO CC linking bioactive molecules to cells expressing PRO polypeptides, for CC linking biological activities of cells expressing PRO CC polypeptides, and for for identifying agonists or antagonists. CC polypeptides, and for for identifying agonists or antagonists. CC polypeptides, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for CC polypeptides for mapping the gene mapping in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for CC polypeptide, and for the preparation of PRO polypeptides, for CC polypeptide, and for mapping the gene which encodes the PRO polypeptide, and for the generating probes for mapping the gene which encodes the PRO polypeptide, and for the generating probes for CC disorders, in gene therapy, for chromosome identification, as C chromosome markers, and for generating probes for PCR, Northern CC analysis, Southern analysis and Western analysis. The present CC Noce: The sequence data for this patent was obtained in electronic CC format directly from the USPTO web site at CC sequence provipesipsDIDEntry.html.

 The invention relates to a secreted and transmembrane polypeptide, termed CC PRO polypeptide, and the polynucleotide encoding it. The polypeptide is CC useful for detecting PRO polypeptides and for linking a bioactive molecule to a cell expressing the above polypeptides, where the bioactive cc molecule is a toxin, radiolabel or an antibody. The bioactive material CC agonists or antagonists of the cell. The polypeptide is useful for identifying agonists or antagonists of the PRO polypeptide, for proparing variants of PRO, as a molecular weight marker for protein electrophoresis purposes and the PRO polynuclectide is useful for recombinantly expressing those cc and the PRO polynuclectide is useful for a hybridisation probe, in CC thromosome and gene mapping, in generation of antisense RNA and DNA, in the preparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and CC screening of therapeutically useful reagents, to construct hybridisation CC probes for mapping the gene which encodes PRO and for the genetic canalysis of individuals with genetic disorders, in gene therapy, for CC chromosome identification, as a chromosome marker and for generating CC invention.

Northern analysis, Southern analysis, Southern analysis and western cCC invention.

 Sequences shown in AAV54616 to AAV54621 represent LU105 specific
CD polynucleotide sequences. These are used in the method of the invention
CD for detecting target LU105 nucleic acid. The method comprises treating a
CD sample with at least one LU105 specific nucleic acid, or its complement
CD which is at least 50 percent identical with the LU105 specific nucleic
CD acid sequences (AAV54616 to AAV54621). LU105 is a lung disease marker.
CD colls transformed with a recombinant expression system that contains
CD LU105 specific nucleic acid fragments, are used to express recombinant
CD LU105 polypeptides which are used to raise antibodies. The antibodies are
CD used to detect the LU105 antigen, and correspondingly this antigen is
CD used to detect specific antibodies, in usual immunoassays. The LU105
CD polypeptides and nucleic acid sequences are used for diagnosis, staging,
CD monitoring, prognosis, prevention, treatment and determination of
CD susceptibility to, lung disease, specifically cancer. The LU105
CD concentration, in altered form or in an unusual body compartment). LU105
CD can be detected in blood, plasma or serum in an inexpensive, non-invasive

 The present invention relates to methods of diagnosing breast cancer in a patient, which comprise detecting the level of expression in a tissue sample of two or more genes selected from those shown in ABT09867.

ABT1112, where a differential expression of the genes indicates breast cancer. The methods are useful in diagnosing, treating, detecting the progression, and in monitoring treatment of breast cancer in patients. The methods are also useful as a screening tool for agents that modulate the onset or progression of breast cancer. The breast cancer genes may be used as diagnostic markers for the prediction or identification of the malignant state of breast tissue, for confirming the type and progression of cancer, and for drug screening and assays. The present sequence is a coding sequence of the invention.

Note: The sequence data for this patent did not form part of the printed appecification, but was obtained in electronic format directly from WIPO

 The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug toxicity, drug efficacy and drug metabolism.

Note: The sequence data for this patent did not form part of the printed as pacification, but was obtained in electronic format directly from WIPO as formation int/min/minliched ref semences.

Screening

```
CC The present invention describes a method (MI) for screening for an CC anti-neoplastic agent. The method involves exposing cells to a chemical CC agent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) CC comprises a sequence (S) selected from 8447 sequences (given in ABL6164 CC expression is indicative of anti-neoplastic activity. (I) has cytostatic expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening CC an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a crenult of MI, and the data is sufficient to convey the chemical CC result of MI, and the data is sufficient to convey the chemical CC structure and/or properties of the agent. MI can be used in the CC cancer such as colon, breast, stomach, lung, thyroid, CC demogrationama, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine CC carcinoma, papillary carcinoma and Wilm's tumour.
 Human; cancer; colon; breast; ovary; oesophagus; kidney; thyroid; stomach; lung; prostate; pancreas; carcinoma; antitumour; cancerous; cytostatic; gene therapy; antineoplastic; Wilm's tumour; adenocarcin

Claim 12; 56pp + Sequence Listing; 56pp; German

cc methylation of a particular cytosine in a motif 5'-CpG-3', present in a cytosine (C) but not methylated (, to uracil, then part of the genomic cytosine (C) but not methylated (, to uracil, then part of the genomic cytosine (C) but not methylated (, to uracil, then part of the genomic CO DNA that contains the target () is amplified to form a labeled amplicon. CC The amplicon is hybridised to two classes, each with at least one cytosine (c) is hybridised to two classes, each with at least one cytosine on the amplicon. From the ratio of labels hybridised to the two classes is determined from the collabel on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method collabes of oligomers, the degree of methylation is calculated. The method collabes of oligomers, the degree of finelylation is calculated. The method collabes of the central nervous, cardiovascular, gastrointestinal and respiratory collabers etc., particularly by detecting mutations or single nucleotide cytosis and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined allows the methylation status of many C residues to be determined allows the collaborate of the invention.

The methylation described in collaborate of the invention.

 cc methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA; The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonuclectides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridised to two classes is determined from the classes of oligomers, the degree of methylation to both classes is determined from the classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of therapeutic drugs, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. And 131410-ABQ54121 represent genomic DNA sequences used to illustrate the content of the invention.

The invention relates to isolated nucleic acid (ABN81319-ABN81324), corresponding to genes differentially expressed in mast cells following activation or in patients with altergic hypersensitivity disease, (I) that encodes proteins (ABB77569-ABB77575) (II) or a protein fragment of (II) if at least 6 amino acids. (II) is useful for identifying binding partners. (I) is useful for diagnosing or treating a disease state (e.g. allergic hypersensitivity, seasonal rhinitis, asthma, urticaria or atopic dermatitits or mastcoytosis) in a subject which involves determining the level of expression of (I) or (II), a computer system, comprising a database containing information identifying the expression level in a tissue or at least one mast cell of (I), is useful for presenting information to identify the relative expression level of (II), is useful in a patient. The protein can also serve as a target that

The present sequence encodes a novel protein kinase. The nucleic acids cand the protein kinases they encode may be used in the treatment and cid diagnosis of diseases associated with inappropriate kinase expression such as immune-related diseases and discorders, cardiovascular disease, neurodegenerative diseases and/or cancers. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays. The kinase expression and activity. Anti-kinase antibodies of kinase expression and activity. Anti-kinase antibodies of and kinase expression and activity. Anti-kinase antibodies and kinase antigonists may also be used as antigons in the production of antibodies of kinase expression and activity. Diseases related to down regulate kinase expression and activity include rheumatoid arthritis, atherosclerosis, autoimmune disorders, complications of organ transplantation, myocardial infarction, immune disorders, cardiomyopathies, strokes, renal failure, control inflammatory pehvic disease, multiple sclerosis, astomator, astomator, pelvic disease, multiple sclerosis, astomator, astomator, pelvic disease, multiple sclerosis, astomator, cancers and creproductive disorders, rhinitis, autoimmunity, diabetes, cancers and

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in AB57020 to AB597374) or by determining the expression profile of a gene group comprising these genes. The expression profile or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition related sequence, which are used in the exemplification of the present part a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.

 A full-length cDNA clone (AAT75036) codes for chicken fringe A (or radical fringe) protein (AAW22065), which has the ability to affect neural specification of cell type identity, proliferative regulation of migratory paths, proliferation of neural crest (branchial arches), definition of morphological boundaries (including limb), cell shape decisions, regulation of apical ectodermal ridge (AER) formation and indirect regulation of proliferative signals. Fringe nucleic acids (see also AAT75034 and AAT75035) can be used to prepare recombinant fringe proteins, to breed transgenic animals and in assays for identifying agents which alter fringe gene expression, and which alter the production of aniogenic precursors, the formation of the AER and the subdivisions of the neural tube.

 This sequence represents the human neuregulin-1 associated gene 1
CC (NNGIAGI) of the invention. The NRGIAGI gene is also referred to as the CC human Schizophrenia gene. The invention also relates to fragments or curaints of the gene and the NRGIAGI polypeptides they encode. The CC NRGIAGI nucleic acids and polypeptides may be used in the prevention, CC diagnosis and treatment of diseases associated with inappropriate NRGIAGI expression. For example, they may be used to treat disorders associated with inappropriate NRGIAGI CC expression. For example, they may be used to treat disorders associated with inappropriate NRGIAGI CC inactive proteins or to supplement the patients own production of CC NRGIAGI. Additionally, the gene may be used to produce NRGIAGI CC polypeptides, by inserting the nucleic acids into a host cell and CC polypeptides, by inserting the nucleic asids in sequence NRGIAGI CC polypeptides, by inserting the nucleic asids in sequence of similar nucleic acids in samples, and therefore which CC patients may be in need of restorative therapy. The NRGIAGI expression and CC patients may be in need of restorative therapy. The NRGIAGI expression and CC activity, anti-NRGIAGI antibodies and antagonists may also be used to down regulate expression and activity, anti-NRGIAGI antibodies and antagonists may also be used to complete the sequence of NRGIAGI antibodies and antagonists may also be used to complete the protein and activity, anti-NRGIAGI antibodies and antagonists may also be used to complete expression and activity, anti-NRGIAGI antibodies and antagonists may also be used to complete the protein and activity, anti-NRGIAGI antibodies and antagonists may also be used to complete the protein and activity. Anti-NRGIAGI antibodies and antagonists may also be used to complete the protein and activity and the protein and activity and the protein and activity and the protein and the protein and activity and the protein and activity and the protein and activity and the protein and the protein and the prot

This sequence represents the human neuregulin 1 gene of the invention.

The invention also relates to fragments or variants of the neuregulin 1 gene. The gene and its proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate neuregulin 1 expression, such as schizophrenia. For example they may be used to treat disorders associated with decreased neuregulin 1 expression by rectifying mutations or deletions in a patient's genome that affect the activity of neuregulin 1 by expressing inactive proteins or to supplement the patients own production of polypeptides. Additionally, the gene may be used to produce the neuregulin 1 protein, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The gene and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The protein may also be used as antigens in the production of antibodies against neuregulin 1 and in assays to identify modulators of neuregulin 1 expression and activity. The antibodies and

 The invention relates to human diagnostic and therapeutic (dithp)

polymucleotides and their associated polypeptides (DITHP polypeptides).

The sequences of the invention are used in the treatment and diagnosis of cell proliferative disprders (e.g. atherosclerosis, cirrhosis), cancers (e.g. tumours of the adrenal gland, bone, bone marrow, brain, breast, cervix, kidney, lung, o'vary, pancreas, proseate, skin, spleen, testis or thymus), autoimmune/inflammatory disprders (e.g. asthma, bronchitis, psoriasis, osteopprosis), viral infections, bacterial infections, fungal infections, parasitic infections, developmental disorders (e.g. anaemia, epilepsy), seizure disorders (e.g. cerebral paley, spina bifida), endocrine disorders (e.g. thrombosis, aneurysm), metabolic disorders (e.g. obesity, diabetes), neurological disorders (e.g. spina bifida), amyotrophic lateral sclerosis, multiple sclerosis), gastrointestinal disorders (e.g. ulcerative colitis, lyeniuria) and transport disorders (e.g. ulcerative colitis, peripheral neuropathy). Sequences ABK71535-ABK71809 represent human dithp polynucleotides of the invention.

 The invention relates to identifying a compound useful for treating inflammatory bowel disease (IBD). The method involves assaying the compound for its ability to modulate the activity or amount of 30ST4 (heparan sulphate D-glucosaminyl 3-0-sulphotransferase-4) isoenzyme. A diagnostic method for determining the susceptibility to IBD is also provided which involves analyzing a DNA sample obtained from a patient for the presence or absence of an allele of a polymorphic marker located on a chromosomal fragment corresponding to the BAC 504N19 (EMBL AF265340), BAC A-249B10 (EMBL AC00228B) or BAC RP11-451N20 (EMBL AC00785). The method is useful in identifying a compound capable of treating IBD, and in diagnosing IBD or in determining the susceptibility or IBD. The compound, which is able to modulate the activity or amount of 30ST4, may also be used in preparing a medicament for the treatment of IBD. The present sequence represents a DNA encoding a human 30ST4
 Sequence 3108 BP; 681 A; 904 C; 897 G;

 within a preparation of glycosaminoglycan or proteoglycan polysaccharides. 3-OST-1 can be used for enriching the antithrombin-binding fraction in a preparation of heparan sulfates (HS). 3-OST-1 can also convert HS proteoglycan anticoagulant precursor to the HS annicoagulant (HSact). The 3-OSTs (optionally lacking enzymatic complex polysaccharides. The 3-OSTs proteins, genes and antibodies are complex polysaccharides. The 3-OST proteins, genes and antibodies are also useful for diagnosis of diagorders involving HS biosynthesis. 3-OSTs are especially used to generate anticoagulant pentasaccharides, which may be used to treat thrombotic disorders such as deep vein thrombotis and pulmonary embolism. Coagulation enzyme inactivation by antithrombin is enhanced by complexing of antithrombin with endothelial cell surface HS proteoglycans. This is responsible for the non-thrombognic properties of blood vessels. The present sequence represents a human 3-OST-4

 TITLE
 JOURNAL
Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial Econf digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

 Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic Strain y2; cn bw sp, the same strain used for the BDGP's pand EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library. Or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

 Submitted (23-UIL-1999) Genoscope - Centre National de Sequencage BP 191 91006 EVRY cedex - FRANCE (E-mail: seqref@genoscope.cns.fr - Web: www.genoscope.cns.fr)

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
 Eukaryota; Metazoa; Arthropoda; Hexapoda; Insecta; Pterygota; Neoptera; Endopterygota; Diptera; Brachycera; Muscomorpha; Ephydroidea; Drosophilidae; Drosophila.

- Web : www.genoscope.cns.fr)
Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de JOD9's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be constituted in the provided by the Conter Can be constituted by partial broat the provided by the BDGP from the BACPAC Resource Center can be constituted by partial broat the provided by the BDGP from the BACPAC Resource Center can be constituted by partial broat the provided by the BDGP from the BACPAC Resource Center can be constituted by partial broat form the BACPAC Resource Center can be constituted by partial broat form the BACPAC Resource Center can be constituted by partial broat form the BACPAC Resource Center can be constituted by partial broat form the BACPAC Resource Center can be constituted by partial broat form the BACPAC Resource Center can be constituted by partial filers

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC |

Library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

 Note="vector: pBluescript II SK-; Site_1: EcoRI; Site_2: Xhol; This library, constructed by John Davies and Jeffrey McDermott, combines cDNAs from CC-1690 cells grown to mid-log phase in TAP (acetate-containing) medium in the light. TAP medium in the dark, HS (mhimmal) medium in ambient levels of CO2 and HS medium bubbled with 5% CO2. PolyA meNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda SAP II (Stratagene) in the EcoRI (5') and XhoI (3') sites. PBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."
